The CTRW limit process should be  $M(t) = A(E(t)-)$  throughout the paper [2], not  $A(E(t))$ . Unless  $A(t)$  and  $D(t)$  are independent, this is a different process. To clarify the argument in Lemma 3.7, note that (here  $q_h(s, t) = P\{A(s) \in S | s < E(t) \leq s + h\}$ )

$$\lim_{h \downarrow 0} q_h(s, t) = P\{A(s-) \in S | E(t) = s\} \quad \text{for } \lambda^1\text{-almost every } s \geq 0$$

since  $s < E(t)$  in the conditioning event, and hence in (3.33) one should write (here  $f(s, t)$  is the density of  $E(t)$ )

$$\begin{aligned} \frac{1}{h} P\{A(s) \in S, s < E(t) \leq s + h\} &= q_h(s, t) \frac{1}{h} P\{s < E(t) \leq s + h\} \\ &\rightarrow P\{A(s-) \in S | E(t) = s\} f(s, t) \end{aligned} \quad (1)$$

and not  $P\{A(s) \in S | E(t) = s\} f(s, t)$  as stated in the paper. For example, consider the case  $A(t) = D(t)$ , a stable subordinator, and  $E(t) = \inf\{x > 0 : A(x) > t\}$ , its inverse or first-passage-time process. Then  $A(E(t)-) < t$  and  $A(E(t)) > t$  almost surely for any  $t > 0$ , by Bertoin [1, III, Theorem 4], and it is clear from (3.24) that  $M(t) < t$  almost surely.
